A French/American mathematician Dr Benoit Mandelbrot discovered Fractals. The word fractal was derived from a Latin word *fractus* which means broken.

What are Fractals?

Fractals are very complex pictures generated by a computer from a single formula. They are created using iterations. This means one formula is repeated with slightly different values over and over again, taking into account the results from the previous iteration.

Fractals are used in many areas such as –

- **Astronomy** – For analyzing galaxies, rings of Saturn, etc.
- **Biology/Chemistry** – For depicting bacteria cultures, Chemical reactions, human anatomy, molecules, plants,
- **Others** – For depicting clouds, coastline and borderlines, data compression, diffusion, economy, fractal art, fractal music, landscapes, special effect, etc.

Generation of Fractals

Fractals can be generated by repeating the same shape over and over again as shown in the following figure. In figure *a* shows an equilateral triangle. In figure *b*, we can see that the triangle is repeated to create a star-like shape. In figure *c*, we can see that the star shape in figure *b* is repeated again and again to create a new shape.

We can do unlimited number of iteration to create a desired shape. In programming terms, recursion is used to create such shapes.

(a) Zeroth Generation

(b) First Generation

(c) Second Generation

Geometric Fractals

Geometric fractals deal with shapes found in nature that have non-integer or fractal dimensions. To geometrically construct a deterministic *nonrandom* self-similar fractal, we start with a given geometric shape, called the **initiator**. Subparts of the initiator are then replaced with a pattern, called the **generator**.

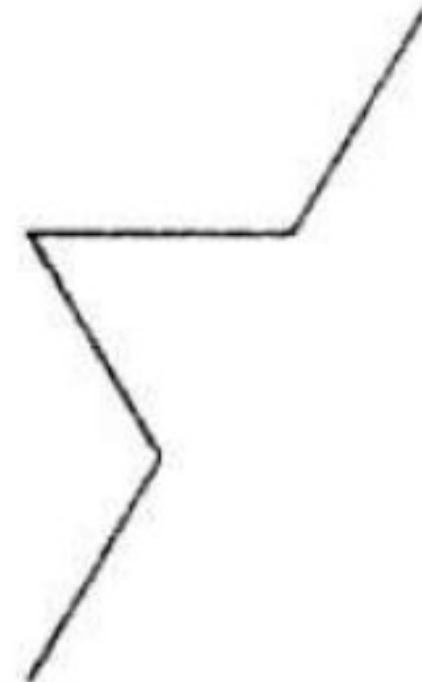

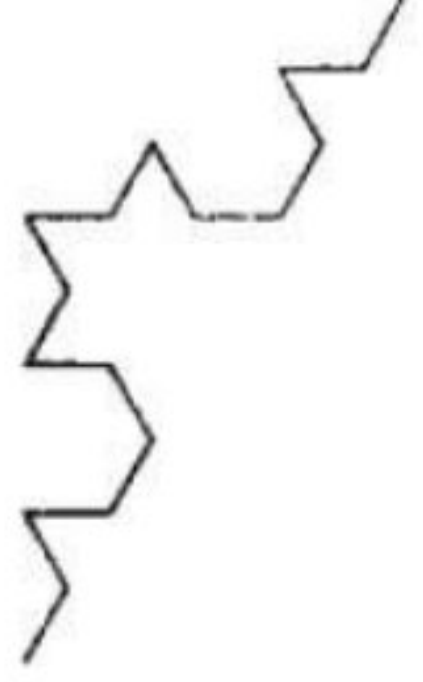

Initiator

Generator

As an example, if we use the initiator and generator shown in the above figure, we can construct good pattern by repeating it. Each straight-line segment in the initiator is replaced with four equal-length line segments at each step. The scaling factor is $1/3$, so the fractal dimension is $D = \frac{\ln 4}{\ln 3} \approx 1.2619$.

Also, the length of each line segment in the initiator increases by a factor of $4/3$ at each step, so that the length of the fractal curve tends to infinity as more detail is added to the curve as shown in the following figure –

Segment Length = 1	Segment Length = $1/3$	Segment Length = $1/9$
		
Length = 1	Length = $4/3$	Length = $16/9$
